Abstract (Basic): **DE 10063039 A1**

NOVELTY - The supporting wall structure for a trench has equidistant vertical supports (1,2), along the trench, with paired and spaced spreaders (6). Plates (4) are inserted vertically into the trench, with their edges in guide channels at the supports. Chord carriers (8,9) extend over at least two wall sections, at the outer sides of the supports, to be fastened to the supports and the plates to form the trench walls by clips (7) pushed into place over the chord carriers and the upper edges of the plates. Each clip has a clamping pad at the inner side of a plate and a second clamping pad at the outer side of the chord carrier, with an adjustable gap between the clamping pads.

USE - The assembly is a supporting wall structure at a trench.

ADVANTAGE - The structure gives a rapid and secure fastening between the outer horizontal carriers and the trench wall.

DESCRIPTION OF DRAWING(S) - The drawing shows a schematic plan view of the trench supporting wall structure.
